DETAILED ACTION

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claims 15-29 are rejected under 35 U.S.C. 102(e) as being clearly anticipated by Turner (6498474). Turner discloses the same invention as claimed: A method for determining a rotation speed and a rotation direction of a component 12, in particular a transmission output shaft, with a sensor device 22, in which a first sensor signal 40 and a second sensor signal 42 are generated as a function of a rotation speed and rotation direction of the component (12), the first and second sensor signals being phase shifted relative to one another and which, whenever the first and second sensor reach one of an upper switching threshold (44) or a lower switching threshold (see Low of Fig.4), trigger a switching signal in the sensor device (22), such that whenever there are alternating and consecutive switching signals of the first and second sensor signals (40 and 42), a pulse signal is emitted as a function of which a variation of a sensor output signal is generated, which is used to determine a rotation speed of the component, wherein when the component (12) reverses rotation direction a pulse signal of the sensor device (22) is only generated when a rotation movement of the component (12)

Application/Control Number: 10/773,655 Page 3

Art Unit: 2862

is recognized, the rotation movement of the component (12) being sensed when, in alternation, a switching signal of one of the first and second sensor signals (40 and 42) and after it a switching signal of the other first and second sensor signals occur; for pulse signals, rectangular, pulse with, pulse height, and others, see Figures 4-5. Although specific columns, figures, reference numerals, lines of the reference(s), etc. have been referred to, Applicant should consider the entire applied prior art reference(s).

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Dr. Bot LeDynh whose telephone number is 5712722231. The examiner can normally be reached on Maxiflex.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Edward Lefkowitz can be reached on 5712722180. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic

Business Center (EBC) at 866-217-9197 (toll-free).
